

VMIP

Visitor Medical Insurance Platform

Health Insurance Administration Platform (HIAP)

Workflow & User Journey

End-to-end operating model across all stakeholders

DOCUMENT	Workflow & User Journey
VERSION	1.0
PLATFORM	VMIP
STATUS	For review

1 Overview

This document describes the end-to-end user journey for the Visitor Medical Insurance Platform (VMIP).

VMIP is the single Health Insurance Administration Platform used by all stakeholders through role-based access. It serves as the authoritative source of truth for policies, eligibility, pre-authorisation, claims, provider administration, and reporting. External systems integrate with VMIP through dedicated microservices.

2 Platform Architecture

VMIP brings internal insurance and clinical roles together with the external systems it connects to. Each user sees only the functions relevant to their responsibilities.

INTERNAL USERS	EXTERNAL SYSTEMS
Minet Insurance Administrators	ECS (eTA & Immigration)
Claims Officers	Health ID
Medical Review Officers	Email Gateway
Underwriter Administrators	WhatsApp Gateway
Hospital Administrators	
Doctors	
Nurses	
Pharmacy Users	
Laboratory Users	
Radiology Users	
VMIP System Administrators	

3 User Journey

At a high level, information flows from the traveller through immigration and integration services into VMIP, then out to the healthcare provider and into claims and reporting.

4 Detailed Journeys

Journey 1 - Insurance Purchase

Step 1 - Traveller applies for an eTA

The traveller submits an application through the ECS portal. Information collected includes:

- Personal information
- Passport details
- Nationality
- Intended travel dates
- Destination information

Step 2 - Product Catalogue

The ECS Integration Service requests the available insurance products from VMIP. VMIP returns available products, benefits, premium, underwriter, coverage limits, and terms and conditions. The traveller reviews and selects an insurance plan.

Step 3 - Purchase Confirmation

The traveller completes payment within ECS and ECS confirms the purchase to VMIP. VMIP then creates the traveller profile, insurance policy, coverage, and certificate, and stores the policy as the authoritative record.

Journey 2 - Entry into Kenya

Step 4 - Entry Confirmation

When the traveller enters Kenya, ECS sends an Entry Confirmed event to VMIP. VMIP updates the policy status to Active and coverage begins immediately.

Journey 3 - Hospital Visit

Step 5 - Arrival

The traveller visits an empanelled healthcare provider and hospital staff access VMIP. The traveller provides their passport, Health ID, and policy number (optional).

Step 6 - Identity Verification

VMIP verifies the traveller using Health ID. Verification methods may include:

- Passport verification - staff compare the details fetched from ECS against the physical passport.
- Fingerprint verification - the traveller provides fingerprints for biometric verification.

If verification fails, the provider may perform a manual identity verification process.

Step 7 - Eligibility Verification

Hospital staff request eligibility from within VMIP. VMIP validates the active policy, entry confirmation, coverage period, product benefits, and benefit limits, then returns:

- Eligible / Not Eligible
- Benefit package
- Remaining limits
- Coverage details
- Applicable exclusions

If the traveller is not eligible, the visit proceeds according to the provider's self-pay process.

Journey 4 - Clinical Assessment

The clinician evaluates the traveller. Clinical information captured includes the chief complaint, diagnosis, clinical notes, vital signs, laboratory requests, imaging requests, and medication. Clinical information remains within VMIP.

Journey 5 - Pre-authorisation

Certain procedures require prior approval.

Step 8 - Pre-authorisation Request

Hospital staff submit the diagnosis, requested procedure, estimated cost, supporting clinical documentation, and practitioner details. The request is routed internally within VMIP to the Medical Review queue.

Step 9 - Medical Review

Medical Review Officers evaluate policy benefits, medical necessity, benefit limits, exclusions, and supporting documentation. Decision outcomes include Approved, Partially Approved, or Declined. The decision is immediately visible to the healthcare provider within VMIP.

Journey 6 - Treatment

Treatment proceeds immediately for services not requiring pre-authorisation, after approval for services requiring pre-authorisation, and according to emergency treatment rules where applicable. Clinical documentation is completed within VMIP.

Journey 7 - Claim Submission

Upon completion of treatment, the healthcare provider submits a claim. Claim information includes the diagnosis, procedures, services rendered, medications, supporting documentation, and clinical notes. VMIP validates that all required information has been provided before accepting the claim.

Journey 8 - Claim Review

Claims Officers review submitted claims. Validation includes eligibility, benefit rules, policy conditions, medical necessity, duplicate claims, clinical documentation, and fraud indicators.

Claim statuses include:

- Draft
- Submitted
- Under Review
- Pending Information
- Approved
- Rejected
- Closed

Status changes are visible immediately within VMIP.

Journey 9 - Additional Information

If further documentation is required, VMIP notifies the provider. The provider uploads any missing documents, clinical notes, laboratory reports, and imaging reports, and the claim returns to review.

Journey 10 - Claim Outcome

Claims Officers record the final outcome - Approved, Partially Approved, or Rejected. The provider can view the decision, reason codes, and reviewer comments.

Journey 11 - Notifications

VMIP sends notifications throughout the journey. Events include:

EVENT	EVENT
Policy Created	Claim Submitted
Policy Activated	Claim Under Review
Eligibility Confirmed	Additional Information Requested
Eligibility Failed	Claim Approved
Pre-authorisation Submitted	Claim Rejected
Pre-authorisation Approved	Claim Closed
Pre-authorisation Declined	

Delivery channels may include SMS, email, WhatsApp, and in-application notifications.

Journey 12 - Reporting

VMIP provides operational dashboards for authorised users. Examples include policy statistics, active travellers, hospital utilisation, claims volumes, pre-authorisation volumes, approval rates, product utilisation, underwriter performance, and audit reports.

5 End-to-End Workflow

The complete operating sequence, from application through to reporting.

6 Guiding Principles

- VMIP is the single web application used by all stakeholders.
- VMIP is the system of record for all insurance administration data.
- External systems integrate only through secure APIs and dedicated microservices.
- Healthcare providers never interact directly with external insurance systems.
- Role-based access ensures each user sees only the functions relevant to their responsibilities.
- Healthcare interoperability uses HL7 FHIR R4 resources where applicable for patient, coverage, eligibility, clinical documentation, and claims.
- Financial payment processing is outside the scope of the current implementation and may be introduced in a future phase.
